## CLIPPER PLUGIN MANUAL VER. 1.1

2018 © Giuseppe De Marco

The clipper plugin is a python plugin that performs a missing feature of current (3.0) Qgis Version: clipping of features inside the same shapefile from a selected feature (line or polygon). Polygon clipping from a selected polygon feature clips all intersecting features and returns clipped features with the same attributes deleting old ones: do not worry you have to confirm your edits by saving edits for the layer manually! Linestring clipping should be considered as trim/split feature: it takes as cutting line a selected line from active layer and split all intersecting lines. After the splitting you will have the chance to manually delete unwanted split parts.

### 1.1 Usage

1. Set a layer active and select a clipping/cutting feature (line or polygon) otherwise the plugin will complain about no active layer found or no selected feature . . .
2. Click on the plugin button in plugins toolbar or access *Clipper* plugin, going to *Vector* → *Clipper* → *Clipper*.
3. Check for the result in Map Canvas and if it is satisfactory save edits.

### 1.2 Preview (for polygons only)

- 1.1) Set a layer active and select a clipping/cutting feature otherwise the plugin will complain about no active layer found or no selected feature. . .
- 2.1) Access *Clipper* plugin, going to *Vector* → *Clipper* → *Intersection Preview* and you will be shown a new memory layer in legend with the intersecting polygon parts
- 2.2) Access *Clipper* plugin, going to *Vector* → *Clipper* → *Clipping Preview* and you will be shown a new memory layer in legend with the clipped polygons
- 3.1) If the result is fair enough you can either close the message widget and run *Clipper* plugin either push ‘Clip’ button in the widget: this will fire up the clipping process anyway. . .
- 4.1) Remember to save your edits if you wish to keep modifications.

### 1.3 clip with multiple selection(for polygons only)

- 1.1) Set a layer active and select a clipping/cutting feature otherwise the plugin will complain about no active layer found or no selected feature. . .

2.1) Click on the plugin button in plugins toolbar or access *Clipper* plugin, going to *Vector* → *Clipper* → *Clip with Multiple Selection* and you will be clipping the intersecting polygon parts around any selected feature of the layer

## 1.4 clip layer and paste intersecting features in the clipped layer(for polygons only)

1.1) Set a layer active and select a clipping/cutting feature otherwise the plugin will complain about no active layer found or no selected feature. . .

2.1) Click on the plugin button in plugins toolbar or access *Clipper* plugin, going to *Vector* → *Clipper* → *Clipper paste Intersection* and you will be clipping the intersecting polygon parts any selected feature of the layer pasting the intersection into the clipped layer
